Safeguarding the port security with quick responses to counter potential threats

Implemented to address threats like terrorists and smuggling of weapons, the SecurePort system aims to provide a flexible centrally-managed security infrastructure for ports featuring decision support systems that maximize the utility of the installed security equipment base.

ENHANCED THREAT DETECTION AND SITUATIONAL AWARENESS

With intelligent sensor and data processing, SecurePort can identify and detect possible threats and do a risk assessment of the risk. The built-on Decision Support capability will also provide a recommendation of the mitigating actions. This comes in the form of an Incident Management plan which manages and tracks the

threat incident.

With the multi-sensor integration with resource management and tracking features, situational awareness can be enhanced.

ESTABLISH MORE EFFICIENT COMMUNICATION PLATFORM

By providing an integrated solution for both wired and wireless, data and voice connectivity, communication can be improved. Mobile data communications can provide the operators with real-time resource management and mobile command and tracking capabilities.

With enhanced communication, SecurePort can facilitate a smooth and fast mean for response actions and alerts.

SOLUTION FEATURES

- Real-time decision support
- Comprehensive situational picture
- Enhanced Legacy Security Systems

SecurePort is a technologically advanced solution to the port security concern. It enables port security authorities to cost-effectively optimise and improve the operational effectiveness of existing security sensors, communications and controls.
